Emerging adulthood
Dark side of identity

ABSTRACT

The aim of this special issue is to shed light in the dark side of identity formation in adolescence and emerging adulthood, that is, to provide some understanding in what exactly can go wrong in identity development. After summarizing the recent developments in identity development literature, in this introduction the main findings of all thirteen empirical papers are summarized into three overarching themes: (1) lack of identity integration as a risk factor, (2) reconsideration of commitment as a sign of identity uncertainty, and (3) ruminative exploration as another risk factor undermining healthy identity development. Finally, given that all papers in this special issue are based on conference presentations at the 14th Biennial Conference of the European Association for Research on Adolescence (EARA), some more information on that conference is included in this introduction.

Identity literature: a look at recent developments of the field

Identity research represents a bulk of adolescent and emerging adulthood literature. Interest for identity formation has been largely prompt by Erikson's (1950, 1968) pioneering contribution and by subsequent models, such as Marcia's (1966) identity status paradigm, which has operationalized more specifically the richness of Erikson's thought. In the last decades, the identity literature has undergone substantial developments, which have led to an enhanced interest for unraveling the fascinating process by which individuals define themselves, exploring identity alternatives and choosing meaningful commitments across various life domains. In particular, significant advancements in the identity field includes: development of theoretical and empirical extensions of Erikson's and Marcia's contributions; longitudinal focus on multiple antecedents, correlates, and consequences of identity; and study of identity in a large array of cultural and social groups.

First, a new lymph to the identity literature has been provided by the development of new process models that extended Marcia's (1966) identity status paradigm (for reviews see Meeus, 2011; Schwartz, Luyckx, & Crocetti, 2014). Luyckx and colleagues' five dimensional model (Luyckx, Goossens et al., 2006; Luyckx, Schwartz et al., 2008) and Meeus, Crocetti, and

collaborators' three-factor model (Crocetti, Rubini, & Meeus, 2008; Meeus, van de Schoot, Keijsers, Schwartz, & Branje, 2010) offered new conceptualizations of the identity dynamics, highlighting different forms in which individuals can form, evaluate, and revise their identities. Furthermore, applications of both models showed that by considering more identity processes and applying empirically based methods of classification it was possible to disentangle various types of identity statuses, such as different forms of diffusion (carefree diffusion and diffused diffusion; Luyckx, Schwartz et al., 2008) and moratorium (moratorium and searching moratorium; Crocetti, Schwartz, Fermani, Klimstra, & Meeus, 2012), which were not initially encompassed in Marcia's paradigm. Also research based on an innovative narrative approach (e.g., McAdams & McLean, 2013), with strong roots in original Eriksonian theory, led to new insights and deeper questions about the developmental processes of identity. All these new contributions clearly showed that young people can enact different developmental patterns. Importantly longitudinal studies have revealed that identity is characterized by a combination of change and stability (Meeus, 2011). For instance, Meeus et al. (2010) found that over the course of adolescence, 63% of youth remained in the same identity status whereas 37% of them changed statuses, with progressive changes being more common than regressive changes. Thus, process models and narrative approaches have provided renewed frameworks to study identity formation in adolescence and emerging adulthood and have stimulated a new reflection on the specifics and meaning of various identity processes.

Second, a further main development of the identity literature has been given by an extended focus on various antecedents, correlates, and consequences of identity. An increasing number of longitudinal studies have disentangled reciprocal influences between identity and individual characteristics, such as personality (Klimstra, Luyckx, Germeijs, Meeus, & Goossens, 2012; Luyckx, Soenens et al., 2006), time orientation (Luyckx, Lens, Smits, & Goossens, 2010; Shirai, Nakamura, & Katsuma, 2012), internalizing (Crocetti, Klimstra, Keijsers, Hale, & Meeus, 2009) and externalizing (Crocetti, Klimstra, Hale, Koot, & Meeus, 2013) problem behaviors, and mental health (Schwartz et al., 2015). Furthermore, longitudinal evidence has provided new insights in how proximal and distal social contexts shape and are shaped at the same time by youth identity. In this respect, meaningful associations between identity and family (Beyers & Goossens, 2008; Schwartz, Mason, Pantin, & Szapocznik, 2009) and community (Crocetti, Garckija, Gabrielavičiute, Vosylis, & Žukauskiene, 2014) contexts have been unraveled. Thus, longitudinal studies have highlighted that identity is strongly intertwined to adolescent and emerging adult psychosocial development.

Third, a very important advancement in the identity literature has been given by the increase in diversity. While in the Sixties and Seventies most identity studies included only university students (see Schwartz, 2005; for a discussion), the last decades documented a large diversity in the origin, status, and culture of participating adolescents and emerging adults. First of all, a main advancement has occurred in the study of ethnic minority youth. A wide corpus of evidence has provided new insights on how ethnic minorities, growing up in the US and in other Western countries in which multiculturalism is constantly increasing, develop their ethnic identity and how this influences their mental health and well-being (Rivas-Drake et al., 2014; Syed & Azmitia, 2010; Umana-Taylor, Zeiders, & Updegraff, 2013). Furthermore, it has increased the number of studies that investigate how identity develops in community samples drawn from the general population as well as in understudied groups, such as juvenile delinquents and clinically referred youth (Klimstra et al., 2011) and youth with chronic diseases (Luyckx, Seiffge-Krenke et al., 2008). Finally, identity researchers took up the challenge of studying more in-depth the "neglected 95%" (Arnett, 2008), largely increasing the number of studies in non-American samples. These studies include both studies focusing on identity in specific understudied national groups (e.g., identity in Filipino youth; Pesigan, Luyckx, & Alampay, 2014) as well as cross-cultural comparisons involving youth from different continents (Crocetti et al., 2015). This increase in diversity is highlighting international perspectives in similarities and differences in how youth around the globe develop their identity (Berman, 2011; Schwartz, Zamboanga, Meca, & Ritchie, 2012).

Moving the field forward: new insights from the current special issue

This special issue will further contribute to advance the identity field, by focusing particularly on the dark side of identity formation. All new insights on identity development summarized above clearly showed that young people can enact different developmental patterns. However, a question that remains and that is highly relevant for youngsters struggling with their identity development as well as for clinicians dealing with them, is whether and how these new insights on identity development help us to shed light on the dark side of identity. More specifically, a main question is whether these progresses of the identity research field help us to explain what is exactly going wrong with young people that in adolescence and even at the age of emerging adulthood are still confused or diffused.

The first set of papers in this special issue focuses on the importance of identity integration, a key feature of healthy identity development according to Erikson (1968). Without good identity integration, individuals experience lack of continuity and persistence. Syed and McLean clearly define identity integration and illustrate in their theoretical article how a lack of identity integration hampers psychological functioning. Doing so, they discuss four different forms of integration: contextual integration, temporal integration, ego integration, and person-society integration. How identity exactly is integrated is studied by Solomontes-Kontouri and Hatzitoffi in a sample of Cypriot young inmates, with a focus on temporal integration. Participation in educational programs inside prison turns out to be a strong vehicle towards positive identity integration. Aydinli and Dimitrova focus on the importance of contextual integration. Turkish immigrant youth in Germany and Bulgaria who show a coherent social identity (comprising ethnic, national, and religious identity) showed less negative affect. When one of these identity domains is not integrated in the overall social identity (e.g., national identity), it is not an

asset. Finally, in line with this, Benish-Weisman shows that a strong ethnic identity in Israeli adolescents with an immigrant background predicts relative decreases in peer nominated aggression over a two-year period, as such underscoring the importance of strong ethnic identity for preventing aggression during adolescence.

The second set of papers in this special issue provide further validity of the Meeus, Crocetti, and collaborators' three-factor model (Crocetti et al., 2008; Meeus et al., 2010) of identity formation. Healthy in-depth exploration and commitments are differentiated from troubled reconsideration of commitments. The latter is the process by which adolescents compare their present commitments with other possible alternatives and try to change the present unsatisfactory commitments with new ones (Crocetti et al., 2008). In a three-wave longitudinal study on a Romanian sample of adolescents, Pop et al. demonstrate that high academic achievement leads to high levels of commitment (identity synthesis), while low academic achievement leads to high levels of reconsideration of commitment (identity confusion). A person-oriented approach is presented in the next two papers. Morsünbül et al. identified several problematic identity profiles in a sample of Turkish adolescents. Particularly adolescents in the diffusion status (low in-depth exploration and commitment) showed problems in different areas of their life (personality, interpersonal relationships, group identification, anxiety, and depression). Adolescents in the searching moratorium status (high in-depth exploration and commitment, but also high reconsideration of commitment) were more anxious and reported lower quality of relationships with peers, particularly at older age. The latter was confirmed in the study by Hatano et al. on Japanese adolescents. Youngsters in the searching moratorium status are well functioning in adolescence, which also in Japan is a transitional age period. However, still searching and being uncertain regarding identity in emerging adulthood, results in more externalizing problem behaviors.

The final set of papers in this special issue are all building on the Luyckx and colleagues' five dimensional model of identity formation (Luyckx, Goossens et al., 2006; Luyckx, Soenens et al., 2006; Luyckx, Schwartz et al., 2008). In this model Marcia's dimensions of exploration and commitment are unpacked into two exploration dimensions and two commitment dimensions: exploration in breadth, exploration in depth, commitment making and identification with commitment. A fifth dimension, ruminative exploration, was added to the model later. Adolescents high on ruminative exploration experience difficulties with active and purposeful exploration of alternatives. When confronted with identity questions, they brood and worry constantly without being able to close down this exploration process and make strong commitments. Beyers and Luyckx further extend this model by differentiating healthy exploration in depth from reconsideration of commitment. Data in a large sample of Belgian adolescents and emerging adults show that both ruminative exploration and reconsideration of commitment are risk factors that undermine healthy identity development. Ruminative exploration predicted weak commitments and maladjustment. Reconsideration of commitment rendered healthy forms of exploration ineffective. Using data from a large sample of French undergraduates, Cannard et al. related the five identity dimensions in the Luyckx et al. model to students' academic motivation. Exploration in breadth and in depth were underrepresented in demotivated students, and commitment and ruminative exploration were under and overrepresented respectively in amotivated students. Four papers used the Luyckx et al. model in a more person-oriented approach. Marttinen et al. present two-wave longitudinal data from Finnish young adults and based on a Latent Profile Analyses they identify a "dark" identity profile, characterized by weak and unstable commitments and high ruminative exploration. These strongly diffused young adults display more self-focused lifestyle goals and fewer developmental task related goals (e.g., relationships, career). Skhirtladze et al. use the extended model of identity formation (Beyers & Luyckx, this issue) and show that in a sample of Georgian young adults high exploration in breadth was strongly positively related to both reconsideration of commitment and ruminative exploration. A cluster analysis confirmed this, for instance by relatively low levels of exploration in breadth in the well-adjusted identity Achievement cluster and relatively high exploration in breadth in the maladjusted Troubled Diffusion cluster. Clearly, exploration in breadth functions differently in the normative Georgian cultural context. Focusing on vocational identity formation, Lannegrand-Willems et al. present data from French adolescents and emerging adults and confirm that particularly high ruminative self-doubt about job and career is associated with higher depression and lower satisfaction with life. Cluster analysis identified two clearly maladjusted identity statuses, in which both high self-doubt and reconsideration are combined with low commitment making and identification with commitment, that is, Moratorium and Diffused Diffusion. Most interestingly, also a Carefree Diffusion cluster was identified, comprising emerging adults with a passive attitude towards job seeking and commitment, which was relatively well-adjusted. Finally, presenting longitudinal in-depth qualitative interview data on Swedish young adults that stayed in identity diffusion between 25 and 29 years, Carlsson et al. showed that these seemingly carefree diffused young adults become increasingly disengaged over time, as indicated by their avoidant approach to changing life conditions, their weak meaning making, and dissolving personal life direction across time.

The origin of this special issue

The papers of this special issue are all based on conference papers presented at the 14th Biennial Conference of the European Association for Research on Adolescence (EARA). The conference took place between September 3 to 6, 2014 in Çeşme, near İzmir, in western Turkey. About 320 participants attended the conference and in total 6 keynotes, 7 invited symposia, 32 symposia, 24 thematic sessions, and few special sessions were scheduled in the conference program as well as 90 poster presentations. The papers presented touched upon various issues of adolescent development such as youth political and civic engagement, interpersonal difficulties, stress and coping, parental relationships, school climate and education, the transition to adulthood, connectedness and individuation across cultural contexts, cross-cultural research, bullying and cyberbullying, adolescent immigrants, LGBT youth, socialization of tolerance, prosocial behaviors and some others.

A considerable number of interesting papers and posters investigating identity formation in adolescence and emerging adulthood were also presented. Especially papers focusing on the process of identity development and papers shedding light on the negative side of identity development were noticeable. As a consequence, the aim and theme of this special issue of the journal was decided to shed light on the dark side of identity development.

All presenters of these identity related contributions were invited to submit abstracts for this special section. From 29 submitted abstracts, the guest editors selected a shortlist of 15 abstracts with great interrater reliability (intraclass correlation = .97). Selection was based on a set of criteria decided a priori, including the abstract being based on the Çeşme program (origin), the topic matching the theme of this special issue, strong conceptualization of concepts and research questions, clear hypotheses, general interest of the research (content), sample, measures and analyses, credibility and method fitting in with the research questions (method), promising results and clear tables of figures (results), clinical relevance, and quality of English writing. Authors of selected abstracts then prepared and submitted their papers or brief reports, of which 13 finally made it to this special section, after a thorough and blind review process.

Overall, the studies that comprise this special issue define and illustrate several maladaptive processes the might undermine healthy identity formation and lead to identity diffusion, including a lack of identity integration at different levels, staying in identity diffusion, weak ethnic identity for immigrants, reconsideration or uncertainty about commitments, amotivation, and ruminative exploration. In depth study of these maladaptive processes can shed light on the dark side of identity formation and, as such, be of interest for counselors who work with youth struggling with this important developmental task. As editors, we are delighted to contribute to this by presenting this special issue in *Journal of Adolescence*.

Acknowledgments

We thank most sincerely all participants who brought their interesting data and experience to Çeşme as indicated by the high level of presentations and symposia. Thanks are also due to all sponsors of the conference, to the EARA Council, all our colleagues, friends and families for their support at different stages of preparation and running of the meeting. We deeply appreciate participants who prepared the papers in this special issue for publication.

We further would like to thank the following expert reviewers who contributed to this special issue by providing excellent feedback to the papers: Arzu Aydinli, Christine Cannard, Cyrille Perche, Eleanora Ioana Pop, Elina Marttinen, Elisabetta Crocetti, Figen Çök, Gregoire Zimmermann, Hal Grotevant, Jane Kroger, Wim Meeus, Johanna Carlsson, Kai Hatano, Susan Branje, Katariina Salmela-Aro, Kate McLean, Kazumi Sugimura, Koen Luyckx, Laura Aleni Sestito, Luigia Simona Sica, Lyda Lannegrand-Willems, Maya Benish-Weisman, Moin Syed, Monique Landberg, Nino Skhirtladze, Olga Solomontes-Kountouri, Radosveta Dimitrova, Theo Klimstra, Ümit Morsünbül, Viv Vignoles, and Wim Beyers.

Special thanks also go to Ann Hagel, Matthieu Renaud, and Kavitha Narayanasamy who guided us fluently through the editorial process for this issue on behalf of Elsevier. Finally, special thanks to Henk Weymeis who wrote an excellent clinical oriented reflection for this special issue, illustrating how our research can add understanding and helping youngsters struggling with their identity formation.
